

## HealthPRO Sustainability Video

[JAZZ MUSIC]

Our supply chain is global and extremely complex. A single supplier can rely on 10 or more other suppliers for manufacturing one product which makes it very difficult to have complete oversight. The pandemic certainly challenged this and it continues to challenge our supply chain, but we can and we must do better collectively on all aspects of sustainability.

We need to ensure that our workers are safe no matter where they live. This is the social component of sustainability. We have a duty to the environment. We must do our duty to reduce gas emissions and diverting less medical waste to our landfill.

I was surprised to learn that Canada's health care system is the third highest polluter per capita in the world. Why are we allowing our environment to make people sicker? We can do better.

We also have economic sustainability. We're already part of that with our suppliers achieving economies of scale through national buying power saving the health care system hundreds of millions of dollars every year. But we know we must do even better. That's why we're looking at outcomes based procurement as the next stage. We need to stop harming as we heal. We can do better. We must do better. Let's get to work.
